

Molecular Clouds and Star Formation: The Herschel and Planck View of the 'Galactic Ecology'

John Bally¹

¹Center for Astrophysics and Space Astronomy (CASA)
Department of Astrophysical and Planetary Sciences (APS)
University of Colorado, Boulder

mm/ sub-mm 'Galactic Foregrounds'

... in the era of Surveys

- **Planck:**

All-sky at 5' resolution

30, 44, 70, 100, 143, 217, 353, 545, 857 GHz

- **Herschel:**

Galactic Plane at 5" to 35" resolution

70, 160, 250, 350, 500 μm (Sergio Molinari's talk.)

- **Ground-based: ($V_{\text{LSR}} \Rightarrow$ distances!)**

Galactic Plane 20" to > 60" resolution

lines: HI, CO, NH₃, CS, N₂H⁺, HCO⁺, ...

(& cm continuum:

sub-mm/mm continuum:

Hi-GAL, BGPS, ATLAGAL, ...)

Outline

ISM \Leftrightarrow Star formation: the 'Galactic Ecology'

- **Formation, Evolution, & Destruction of GMCs**

 - Spiral shocks**

 - Gravo-thermal instabilities**

 - Parker / Magneto-rotational instabilities**

 - Super-bubbles (massive-star feedback)**

- **Nearby stars & gas ($d < 600$ pc)**

 - Nearby OB associations & super-bubbles**

- **Dust and gas in the Galactic Plane ($d > 600$ pc)**

 - Spiral arms, super-bubbles, the bar, B, ...**

K Wada (05)

Galactic Ecology: 1

Cloud formation in Converging flows

Powered by spiral arms ?

- Spiral shocks
- + gravity

Gravo-thermal Instability ?

- Cooling + gravity

Magnetic Instabilities ?

- Parker ...
- Magneto Rotational Instability (MRI)
- + gravity

Super-bubbles ?

- SNe => shells + gravity

Bally (08)

Galactic Ecology: 2

Cloud destruction: 'The Feedback Ladder'

- Protostellar jets / outflows - Low Mass
- Soft UV - Moderate Mass
- Ionizing UV - High Mass
- Stellar winds
- Radiation Pressure
- Supernovae

G34.26+0.15

OMC1

W4 / W3

Galactic Ecology: W5 HII region

~100 Myr Galactic Ecology Cycle

- GMCs ($t \sim 10 - 20$ Myr) \Rightarrow HI \Rightarrow HII \Rightarrow HIM

Star formation efficiency (SFE) $\sim 5\% \Rightarrow$

H-atom stays in ISM ~ 20 cycles $\Rightarrow \sim 2$ Gyr

OB stars form, evolve, die in 3 - 40 Myr

Heating / disruption:

- FUV bubbles (10^3 K)

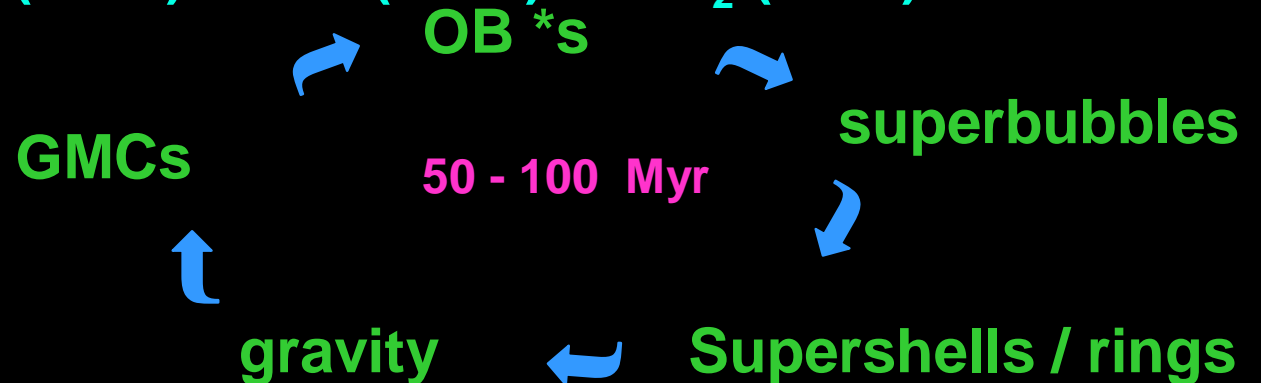

- HII region / wind-bubbles (10^4 K)

- SNe ($>10^6$ K)

- Super-rings \Rightarrow GMCs

Cooling / condensation:

HIM ($>10^6$ K) \Rightarrow HII (10^4 K) \Rightarrow HI (10^3 K) \Rightarrow H₂ (10 K)

Galactic Ecology: Star Formation & the Interstellar Medium

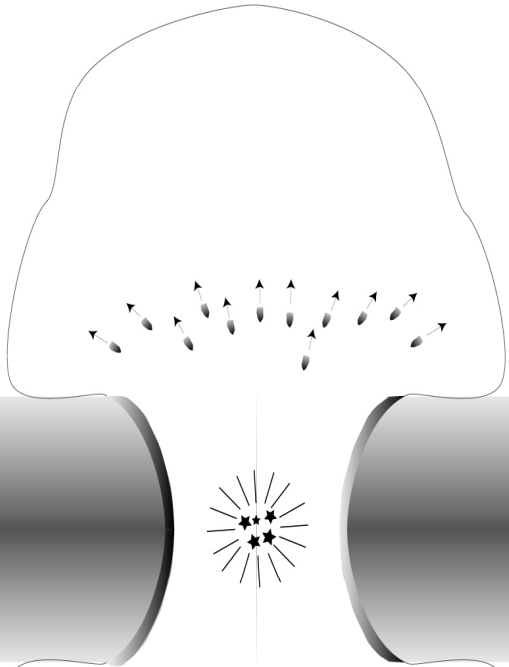

GMC Formation in swept-up Super rings

Gravitational instability of super-rings => $\sim 10^5 M_{\odot}$ clouds
(Kafatos & McCray 87; Mac Low 80s)

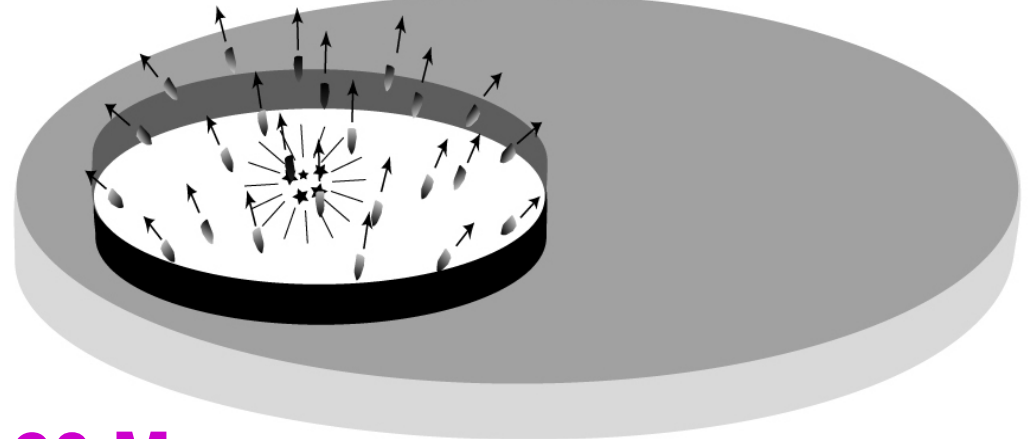

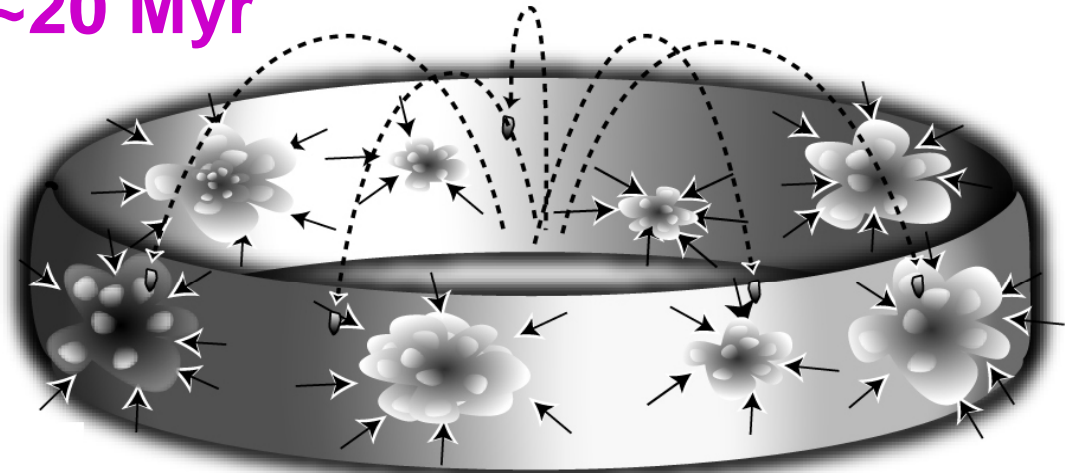

~3- 5 Myr

~10 Myr

~20 Myr

~40 Myr

~60 Myr

Effects on Super-ring Evolution

- **Non-coeval star formation** (Saken & Shull 94)
- **Poisoning**
- **Blow-Out ($r > z$)** (MacLow & Mc Cray 88, 89)
- **Shear (Galactic differential rotation)** (Olano 82; Poppel 96)
- **B fields** (Ferriere et al. 1992; Tomisaka 90)
- **Clumps & structure in ISM**
- **Spiral Density Waves** (Wada 2005)
- **Gravitational Fragmentation** (Kafatos & McCray 87)

Nearby Star Formation: $D < 600$ pc; < 100 Myr

- **Stars:**

- **OB Associations (< 40 Myr):**
 - Sco-Cen, Per OB2, Orion, (Lac OB1)
- **Fossil OB associations**
 - Cas-Tau (α Persi cluster) (> 40 Myr)
- **Gould's Belt stars**

- **Gas & Dust:**

- **Linblad's expanding 21 cm HI ring**
- **HI (Lockman) hole [$l \sim 150^\circ$, $b \sim \pm 45^\circ$]**
- **COBE hole** “
- **HI & H α super-bubbles**
- **Dame et al. CO survey radial velocity**

$d < 500$ pc: Only place where we know X, V in 3D

Conclusions

ISM \Leftrightarrow Star formation: the 'Galactic Ecology'

- **Formation, Evolution, & Destruction of GMCs**

 - Convergent Flows + Gravity**

 - **Spiral waves,**
 - **Cooling instabilities**
 - **Magnetic instabilities**
 - **Super-rings**

 - Destruction**

 - **Massive stars!**

 - Cycle time ~ 100 Myr in near Sun**

- **Key to Galactic / near-Universe 'Foregrounds'**

CONCEPTIONS: Vertical

Thermal wind

- From escaping hot intercloud gas
- Or, a hot halo

Galactic fountain 1

- From escaping hot intercloud gas which cools

Galactic fountain 2

- From superbubbles breaking out above the disk

Thick quiescent disk

- Superbubbles confined
- Spiral density waves
- Ionization mechanism?

Active halo

- Cosmic ray wind
- Microflares
- High z supernovae

CONCEPTIONS: Global

Global thermal wind...

...or a hot halo?

Galactic fountain

Thick Quiescent Disk...

...with nuclear wind?

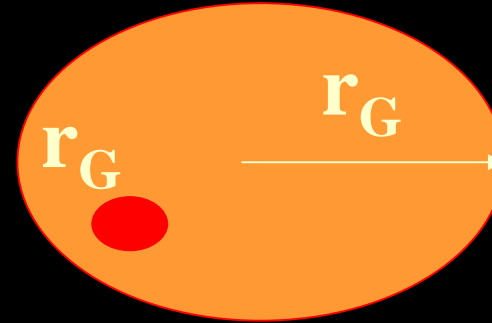

Active halo

Impact of Massive ($M > 8M_{\odot}$) Stars:

SN Rate in Galaxy: $R_{\text{SN}} \sim 1/20$ to $1/100$ (yr^{-1})

SN Rate in Gould's Belt:

$$R_{\text{SN,GB}} \sim R_{\text{SN}} \left(r_{\text{GB}} / r_G \right)^2 \sim 4 \times 10^{-4} R_{\text{SN}}$$

for $r_G \sim 10$ kpc

Swept-Up Mass:

$$M_{\text{GB}} \sim \left(r_{\text{GB}} / r_G \right)^2 M_{\text{ISM}} \sim 4 \times 10^{-4} M_{\text{ISM}} \sim 2 \times 10^6 M_{\odot}$$

Shell Expansion Speed:

$$V \sim 2 - 10 \text{ km/s}$$
